

Network of Transit Priority Lanes

- The *Moving Forward Together Plan* (2016) and *Integrated Mobility Plan* (2017) recommended transit priority improvements on Bayers Road.
- Traffic congestion occurs regularly on Bayers Road and has a significant impact on travel time for buses that impacts service reliability. Running times indicate that buses are regularly delayed by 13-14 minutes during the afternoon peak on Bayers Road. In some cases buses can be delayed up to 28 minutes along this corridor.
- Bus lanes allow buses to move more freely through congested traffic conditions, improving transit travel time and reliability, allowing people to travel more conveniently and efficiently.
- The bus lanes on Bayers Road will connect to transit priority measures that are currently proposed for Young Street and Robie Street. Phase 1 of the Robie Street/Young Street transit priority project - which includes bus lanes on several sections of the corridor - is expected to be implemented in 2020.
- The resulting continuous transit priority corridor across the Halifax peninsula will provide significant potential for moving people more efficiently and conveniently by transit.
